1 Main

1.1 Part 1 - Face Detection

In this project, we aim to construct a face detection model. We used a method haar to extract features. After that, by applying extracted features to cascade method, we were able to detect people's faces and also count the number of faces through pictures as well as webcam. Pre-trained cascade was used from OpenCV.

1.1.1 Part 1.1 - Face Detection without Rotation on Image

We started off the project with face detection on an image.

```
In [132]: import numpy as np
          import os
          import sys
          from pathlib import Path
          from matplotlib import pyplot as plt

In [ ]: # %load ../lib/count_face.py
        def counting_face():
            import numpy as np
            import cv2
            from matplotlib import pyplot as plt

            # loading OpenCV cascade for haar method with frontal face
            face_cascade = cv2.CascadeClassifier('../lib/haarcascade_frontalface_default.xml')

            # loading test image
            img = cv2.imread('../data/test_image/104.jpg')
            gray = cv2.cvtColor(img, cv2.COLOR_BGR2GRAY)
            faces = face_cascade.detectMultiScale(gray, 1.2, 5)

            # implementing model
            for (x,y,w,h) in faces:
                cv2.rectangle(img,(x,y),(x+w,y+h),(0,255,0),8)

            # showing image
```

```

RGB_img = cv2.cvtColor(img, cv2.COLOR_BGR2RGB)
plt.figure(figsize=(12,8))
plt.imshow(RGB_img)
plt.show()

```

In [157]: counting_face()

1.1.2 Part 1.2 - Face Detection with Rotation

After implementation of Part 1, we realized the OpenCV front face cascade could not detect rotated face. Hence, we made some adjustments and declared additional functions to allow our model to analyze images from different rotation angle.

```

In [150]: # %load ../lib/counting_faces_image.py
          #!/usr/bin/env python3
          """

face_dectect_webcam()

1.2 Part 2 - Object Detection API using Tensorflow

After we constructed our model in Part 1, we realized there exist some limitations in cascade model. Cascade model tends to have lower accuracy in side faces or partially showed faces. Also, cascade cannot detect highly rotated faces. To overcome such limitations, a popular and powerful approach is the use of tensorflow. In this section, we implement object detection with a pretrained model, Tensorflow Object Detection API. This model requires intallation of tensorflow. Further instruction of the installation can be referred to https://github.com/tensorflow/models/tree/master/research/object_detection. This model can detect and categorize object, including person, bottle, cellphone, etc. However, cascada model would result better if only faces are showed on an image while this API model would result better if more parts of human body are showed.

1.2.1 Part 2.1 - Object Detection API with Tensorflow on Image

Similar to Part 1.1, we started off with object detection using image. We can see now the model can not only detect human faces but the entire human figure. Moreover, this more advanced model allows us to detect objects other than human, for example, dogs, cats, bottles, cell phones, clocks and so on.
